Installation & Setup

When preparing for installation of your MAAT product, we recommend that you quit all applications prior to proceeding. Also, after downloading the installer and prior to installation, let any anti-malware measures you may have running scan the installer. Then, temporarily disable all anti-malware measures once scanning is complete.

To install, simply double click on the downloaded Installer for your particular operating system. The installation process will guide you through the install procedure. If you have an older OS version, restarting your host may be required. Don't forget to reenable anti-malware measures or simply restart your host.

Licensing

MAAT software is licensed through our dongle-free, cloud-based license control framework. Cloud-based implies a connection to the public Internet, which you will need for at least one computer under your control. That net-connected computer does not have to be the host machine on which you want to run MAAT software. It can be any computer to which you have access; see Offline Activation below.

Also, you can have two simultaneous activations on two different machines. If you want to move your license from one machine to another, be sure to "retire" or deactivate one of your two activations.

Under normal circumstances, even with spotty internet connectivity, you don't have to think about license activation. Basically, you can activate a license on any machine and that activation is valid for a "rolling" 90 day "lease" period. By rolling, we mean that, if at any time during that 90 day period, you open or instantiate a product and the software successfully connects with our license server, the activation period resets once again to 90 days.

If, for whatever reason, the product cannot communicate with the license server, it goes to sleep and waits until next time. So, if you head out to the wilderness with your machine to give your next hit a forest bathing vibe, no worries. The activation will continue for 90 days before it needs to "talk" to our server or manual activation is required. If you need to activate on a computer without a net connection, see Offline Activation below.

Online Activation

There are two ways to activate a license; either by opening the product directly, or by using License Central which is our global licensing utility installed with every MAAT product. If the product is a plug-in, you can open an instance to start the activation process. If the product is stand-alone or "native," then you can simply launch the product. With License Central, see below, you can manage all your licenses within one unified interface.

In-Product Activation

To license your MAAT purchase directly within the product, instantiate an example in your preferred plug-in host. When licensing, we recommend you open a new session in your DAW just for this purpose.

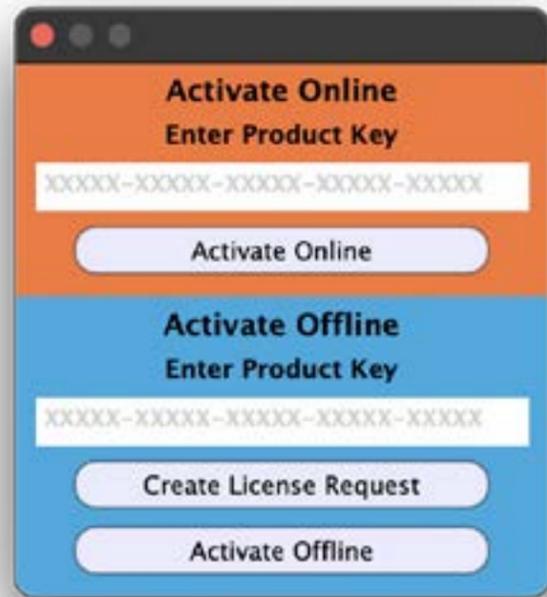

Figure 1: The initial Activation dialog

Instantiate the plug-in or, if an application, launch the product. Wait for the user interface to open, then click on the Preferences' gear icon. Click on the Activate License button. Once the Activation dialog appears, paste or type in your Product Key supplied at the time of purchase. Then click on Activate Online and follow the prompts. Once your product is licensed on a particular host, clicking on the Deactivate Online button will deactivate your license on that machine. Repeat elsewhere to reactivate.

⚡ **NOTE:** THE ONLINE PROCESS REQUIRES LIVE INTERNET TO THE HOST MACHINE. YOU MUST HAVE AN ACTIVE INTERNET CONNECTION FOR ACTIVATION.

License Central Activation

To activate any of your MAAT products or several at once, use License Central...see below.

Offline Activation

Our normal, online activation is an easy, no-hassle way to go. However, if for security reasons, you have an "air gapped" or offline host computer never connected to the Internet, you will need an offline license. This will license your MAAT product without the need for periodic contact with our licensing server. If your studio machine has no public network connection, take a moment to surrender your online license, and replace it with an offline version.

⚡ **NOTE:** AN OFFLINE LICENSE DOES NEED TO BE MANUALLY RENEWED ONCE A YEAR.

To prepare for offline activation, you will need:

1. Your Product Key!
2. Some method to move your License Confirmation file to the offline host machine.

You will need your Product Key that was supplied to you via e-mail when you purchased your MAAT product. That second requirement can be accomplished in any number of ways, but a USB flash drive is often readily available and most convenient.

The offline activation process starts with generating a License Request, with a ".maatr" file extension, which is submitted on-line to our server or via e-mail to MAAT Support <support@maatinc.zohodesk.com>. A License Confirmation file, with a ".maac" extension, will be returned to you, which will activate your product.

To proceed, click on the Activate/Deactivate Offline button, and follow the prompts. In a year's time, 365 days from the date the maatr file was created, a full offline license must be renewed using the same maatr/maac interchange method.

License Central

License Central, located in MAAT's Shared directory, is a free utility that validates, repairs and logs your MAAT licenses. It also displays what MAAT products you have installed and assists in downloading both updates and demos. License Central is installed alongside all MAAT products.

License Central lists all of our products, and shows you:

- If a product is installed and what licenses you have [CLOUD, SUBSCRIPTION, TRIAL, OFFLINE]
- What versions are installed, and which version installers are available for download

It also provides:

- **A one-click download of an update or a demo**

- **A button to activate or deactivate any of your licenses**
- **A copyable list of all your Product Keys**
- **One-click generation of the MAAT diagnostic report**

In Use

When you launch License Central, it scans your host computer and then attempts to match up each product found with a Product Key on our license server. That scanning happens in real time, and the process is shown as a progress bar. When quitting, this process happens in reverse.

Once all the licenses are validated, a list on the left displays all MAAT products, including License Central. Products that are not installed are grayed out, and installed products are displayed in high contrast. To the right of each product entry is a check mark, which indicates that the product is licensed.

Selecting a product entry displays information about the installed version and if an update is available for download.

Controls

There are two persistent buttons along the top. At upper left is Check for Updates, which refreshes the list of installed products, and pings our server again for currently available versions to download. It also recreates your Product Key list.

At upper right, the Activate/Deactivate button brings up the familiar blue and orange MAAT license window, allowing you to deactivate or return your license to the Cloud. If you have requested a 365 day Offline license, use the Create License Request function in the MAAT license window, and have received your “.maatc” confirmation file, you can take your license offline. Finally, you can also paste in a Product Key to activate a new license.

Note: 365 day Offline licenses require a license confirmation file as supplied by MAAT’s support department.

If any product is out of date, a third Download Update button will appear when that product is selected. This button is an express method for updating your MAAT products.

At bottom left of the License Central window is an Auto-Refresh check box, which is selected by default. Deselecting that will prevent License Central from frequently scanning your host for changes including new installs. It starts a scan every 3 seconds, waits for completion of that scan, then begins a new 3 second countdown before starting the next scan. If you find that License Central is interrupting you workflow while scanning, then disable Auto-Refresh.

Preferences

In License Central, the Preferences’ gear icon brings up the Preferences window with four tabs.

Paths

For those who set up alternate directories for the management of their plug-ins in a DAW, two alternate plug-in paths can be defined. These directories will be also included when License Central searches.

Keys

This tab lists all of your Product Keys that are known to our license server. Please take a moment to copy all of your Product Keys, paste them into a text or word processor file, and print out a hard copy. Your Product Keys are your proof of purchase and, without them, your purchase will not work and we cannot provide product support.

Troubleshooting

The Troubleshooting tab has one button, which generates a Diagnostics Report. This report, automatically written to the Desktop, gathers useful, non-personal information about your machine’s state that our support team can use to diagnose any problems.

Info

As with all our products, the Info tab lists credits, copyright information, and the version number you are running.

Introduction

It’s been a long journey to bring this incarnation of Algorithmix’s PEQ Blue to life. We’ve done a lot of development work in order to create an intuitive, useful and ultra-clean EQ tool. As with other members of our thEQ family, thEQblue fills a gap in the landscape of modern audio equalization, exceeding all current hardware and software solutions with practical visualization and superior fidelity.

Each member of our thEQ family fulfills a distinct purpose. thEQ-orange is best for analytical work, such as cleaning up unfortunate mix decisions, removing subsonics, and suppressing noise and clutter at midband and frequency extremes. thEQred, though also linear phase, is for aesthetic applications, where you desire to improve material with spectral sculpting. If you need a low cut, reach for thEQorange. If you’d like to alter timbre or add some tasteful air, then reach for thEQred.

Moving away from linear phase operation is thEQblue. Think of blue as red with attitude. Each of thEQblue’s twelve different “flavors” or Architectures lend an individual vibe while still maintaining the cleanliness of all thEQ products. If you think a traditional or analog EQ will do the trick, then thEQblue should be the first place you go.

Features

thEQblue is the highest fidelity digital collection of classic analog equalizer implementations available.

- Up to one dozen different minimum phase equalizer types, with 10 serial and 2 parallel Architectures in thEQblue12. PEQ (parametric EQ) styles for every taste: standard, vintage, modern and experimental
- Different frequency characteristics: classic, constant-Q, proportional-Q, ideal-Q and special
- True digital implementation of the analog parallel feedback equalizer, normally impossible due to so-called “delay-free feedback loops”
- Sample rates up to 384 kHz, perfectly suitable for high resolution DXD, DSD and gaming production and post
- Extended center frequency settings up to 80 kHz for filtering in the ultrasonic
- Adjustable Q or Quality Factor for shelving and cut filters
- Bell filters in all PEQ types normalized to look identically at 6dB of boost and a Q of 0.71, ideal for fast aural comparisons between different equalizers Architectures
- Twelve Sections with five freely assignable parametric filter types: bell, low-shelf, high-shelf, low-cut, and high-cut
- Extremely low noise and low nonlinear distortion filter algorithms result in residual THD+N in the range of 24 bit quantization noise
- Several low-cut and high-cut filters can be cascaded for brick wall slope characteristics
- Very low noise and low distortion up-sampling technique for getting analog-like filter characteristics when working with base-band (44.1 and 48 kHz) sample rates
- All internal calculations are in 80 bit double floating-point accuracy for extremely low distortion
- Economical CPU usage allowing multiple instances to be open simultaneously
- Parameter editing via numerical fields or directly on the graphical display
- User and factory presets for quick setup comparison

Applications

- Recording studios: tracking, mixing and mastering
- HRA production and post
- High sample rate game audio production and post

- Broadcast production and post
- Sound reinforcement: microphone response improvement, speaker deficiency correction and acoustical room compensation
- Sound design and enhancement
- Audio restoration and forensic audio retrieval
- Transmission loss correction

The Interface

thEQblue’s user interface (UI) may lack the eye candy associated with some products. For a pro user in a dimly lit room who’s face is directed toward a display all day, the UI is designed to convey maximum information with minimum visual fatigue.

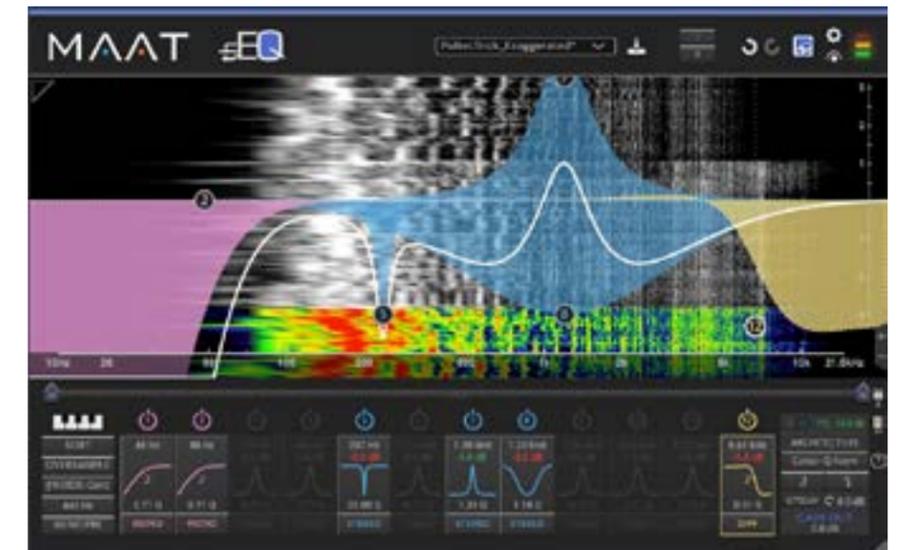

Figure 2: thEQblue’s user interface

Overview

IIR Filters

Every classic IIR-based (Infinite Impulse Response) parametric equalizer uses filters that apply phase shift. The original signal is added to its time-shifted version to get a certain amount of amplitude cancellation or reinforcement at the desired frequency. This procedure can be implemented in the analog domain with capacitors, resistors, inductors, and optional gain/buffer constructs using transistors or “valves” (vacuum tubes). In the digital domain, similar filter characteristic can be simulated by widely copied “minimum phase,” IIR filter topologies. thEQblue is a collection of carefully constructed twelve minimum phase equalizer Architectures.

Filters with phase shift attenuate or amplify a desired frequency, but simultaneously affect the phase of all frequencies. Phase shift causes the time relationship between harmonics to be altered which results in slurred and smudgy impulse response. The narrower the filter (higher Q) or higher the slope (order), the stronger the frequency-dependent phase shift. A very narrow notch used for removing an unwanted tones from a mix does its job, but also changes, sometimes quite dramatically, the sound character of the whole mix. You have probably noticed that equalizers from other manufacturers change the sound of everything, not just the resonant frequency at which you're working. That's because the sometimes substantial phase shift affects all other regions of the original signal along with the target. Filters can, at extreme settings, also produce resonances, which are electrically akin to feedback in the electro-acoustical realm or the ringing of a bell.

Minimum Phase

Though it may seem as though phase-shifting filters are “bad,” in fact most filters, especially real world filters, exhibit phase shift. The big difference between linear phase filters and minimum phase filters is that one is “linear” or constant at all frequencies and the other is not! Not surprisingly, linear phase filters also exhibit phase shift, except it is identical across all frequencies, while minimum phase filter produce frequency-dependent phase shift. Minimum phase Architectures also produce minimal group delay, or frequency dependent time shifting, which is another way of thinking of phase shift. Filters that exhibit more frequency-dependent phase shift than a minimum phase design are classified as non-minimum phase. All Architectures in theEQblue are minimum phase.

For some EQ jobs, frequency-dependent phase shift isn't a bad thing. In fact, it may be what you want to achieve a desired “color” or “vibe.” That's why, within that broad category of minimum phase filters, we at MAAT have provided a range of Architectures or, subjectively, a palette of colors in theEQblue so you can choose which Architecture and accompanying sound character best suits your audio needs.

Introduction

The equalizer is an audio engineer's best friend, one of the oldest and most popular sound processing tools. From the earliest days, its main function has been to correct, to “equalize,” or enhance sound by boosting or cutting certain frequency ranges. Engineers have developed countless hardware equalizers for over a half century. Some became legendary and were considered benchmarks. Our linear phase equalizers, theEQred and theEQorange, and their forbearers are examples of those.

The most popular version in recording and post-production studios is the parametric equalizer or PEQ. It offers maximal flexibility due to direct access to all relevant filter parameters. Properly used, the PEQ is a very powerful tool and the best friend of every sound engineer in

the battle for realizing the client's vision. If misused, it can also inflict serious audible damage.

theEQblue is a creative equalizing tool combining the best of both the analog and digital worlds. We constructed ideal digital implementations of the most legendary analog equalizer Architectures and then went farther, adding some experimental examples only possible in the digital domain. theEQblue's Architectures are not simulations or models of actual hardware products. They are perfect digital implementations of theoretical analog circuits, free of Johnson noise, component variations, thermal effects and secondary effects like mains contamination and PSU modulation and current limitations. By using proprietary filter algorithms, we have achieved a huge dynamic range plus extremely low noise and distortion levels. This unparalleled sound purity is something that's impossible with analog circuitry. theEQblue, while building on the solid foundation of Algorithmix's Classic PEQ Blue, actually improves on that benchmark product, with even higher precision coefficients than the original.

6 versus 12

theEQblue6 and theEQblue12 differ only in the number of **Architectures** available. theEQblue6 offers six series Architectures, №.s 1 through 6, while theEQblue12 offers all twelve Architectures. Those additional six add more series topologies plus two parallel Architectures. We hope you enjoy all the variation in theEQb, and find favorite sounds you previously could get only with very expensive analog gear.

What's So Special

After Algorithmix unveiled its linear phase equalizers, the top mastering engineers certified their unparalleled sound clarity and transparency, declaring them to be the new benchmark worldwide. Back in the day, Dr. Christoph's main intention was to develop an equalizer for critical mastering and re-mastering tasks that could significantly boost or cut complex audio material without adding its own “sound.” Passing this difficult test, Algorithmix customers started asking for a classic PEQ for recording and mixing, but with the world famous Algorithmix purity and transparency. They knew that there was no single PEQ style that could satisfy everyone, but intensive research and development efforts finally resulted in the Classic PEQ Blue, a parametric equalizer with twelve different aspects and the direct predecessor to theEQblue. theEQb is a careful remix of Algorithmix's Classic PEQ Blue, faithful to the original while improving on that benchmark.

- Algorithmically as pure as possible
- How gain and Q interact with each other, and how they interact when cascaded
- A very special type of bell that has the *exact* Q for a wide range of boost or cut

- A very special implementation that allows for easy aural comparison of Architecture
- Not an emulation, sample or model: no analog fingerprint, no added idiosyncratic noise, dynamic behavior, harmonic or phase distortion

In thEQblue, different specific filter dependencies have been implemented between boost, cut and Q, which are especially audible when combining multiple Sections, especially bells or “peaking filters.” In addition, we have implemented very specific filter Architectures whereby any parametric bell can be made identical to any other bell, assuming it covers a similar frequency range, by adjustment of gain and Q. In the real world, Q is not defined in the same way across manufacturer implementations. In other words, you cannot compare thEQblue to another manufacturer’s EQ by assuming the actual Q and gain are the same when set to the same numeric values.

To make the twelve different filter Architectures comparable, all the filters in thEQblue are “Q-Normalized” so that they have the same shape and BW (bandwidth) at +6dB of gain and a Q or Quality Factor of 0.7. This is a unique feature of thEQblue. In addition, we do not simulate the distortion and noise of specific analog EQ products. Our thEQ philosophy is to implement ideally, not emulate or model, the entire range of filter behaviors, especially bells, and their behavior when combined or cascaded. Given a Section of +6.02dB of gain and a Q of 0.71, you can switch freely from one Architecture to another and the curve will be exactly the same within the constraints of each Architecture. This allows you to hear the differences in each Architecture and decide which is right for your application and material.

In Use

Despite its totally unique underlying technology, thEQblue can be handled exactly like any other paramet. The real difference is the sonic result: it equalizes as an ideal minimum phase, without the coloration or artifacts associated with its analog antecedents.

Within a chosen Architecture, you can select any setting constellation which helps you to solve your specific task. A typical configuration consists of a low cut or low shelf in the first Section, a high shelf or high cut in the last or rightmost Section(s), and up to ten bells in the remaining Sections. For special tasks like noise reduction or band limiting, several low or high cut Sections with identical settings can be overlapped or cascaded. Enter filter settings numerically to insure expected action.

Using specific frequency and Q settings, very steep brick wall filters with desired characteristics like Bessel, Butterworth, or Elliptic can be easily created. As a rule of thumb, higher orders produce larger group delay so bear that in mind. Again, higher order may or may not be the sound you’re looking for.

Baseband Operation

Experts say that most digital equalizers don’t “sound” like their analog predecessors, especially when working with 44.1 or 48 kHz sampling frequencies. Spectrum modifications at the higher end of the frequency spectrum sound improperly balanced. The reason is so called “frequency warping,” which makes for asymmetrical bells and shelving/cut filters that are much steeper than expected based on parameters. With some experience, this problem can be partly compensated by fudging parameters. However, the bell asymmetry cannot be avoided this way. To make the filter automatically sound more analog for 44.1 and 48 kHz, we have enhanced thEQblue with low noise and low distortion oversampling. There are two different up-sampling filters, automatically configured according to input sample rate, with coefficients optimally calculated for 44.1 and 48kHz. The THD+N (Total Harmonic Distortion plus Noise) of these filters is below the noise floor of perfectly recorded 24 bit audio. The oversampling process absolutely does not degrade your hard won 24 bit signals. In the case when computational power in your system becomes a problem, you can disable oversampling.

HRA

For modern, “High Resolution Audio” work, thEQblue offers resonant frequency settings up to 174.14 kHz, based on a 384 kHz sample rate. This means thEQb can tailor into the ultrasonic range when sculpting high resolution projects.

User Tip At 88.2 kHz sampling rates and above, the Nyquist frequency is shifted into the ultrasonic. For clean acoustical recordings with no environmental contamination or high resolution samples, thEQblue can be effectively applied at or above 20 kHz to reinforce a palpable sense of “air” and spaciousness of the soundstage.

The Filters

This sub–chapter provides a brief overview of each filter Architecture. For a more in–depth discussion, see our PDF titled Understanding EQ Topologies, available in the Documentation directory on your host computer, and from the product pages of our web site.

<i>Nº</i>	<i>Type</i>	<i>Topology & Range</i>	<i>Description</i>
01	Classic Sym	Serial - +15, -18dB	Series symmetrical, almost constant Q bell — common mix desk & outboard gear Architecture, suggested for “surgical” applications
02	Classic Asym	Serial - +15, -18dB	Series asymmetrical — Old Skool, boost like Nº 1 but with narrower cut

<i>Nº</i>	<i>Type</i>	<i>Topology & Range</i>	<i>Description</i>
03	Proportional 1	Serial - ±15dB	Series proportional — More musical than constant Q, especially for mixing and post. Bells are wider at <6dB and narrower at >6dB
04	Proportional 2	Serial - ±12dB	Series proportional — Like Nº 3 but with bigger changes at large gain settings > ±6dB, suggested for vocals
05	Proportional 3	Serial - ±12dB	Series proportional — Like Nº 3 but with extra wide bells at small gain settings, from 0 to 3dB
06	Const-Q Asym	Serial - ±12dB	Series asymmetrical, constant Q — Boost like Nº 1, cut like Nº 5 (extra wide), as found in some US-made products and mixers
07	Const-Q Asy R	Serial - ±12dB	Series asymmetrical, constant Q — Like Nº 6 but with mirrored boost and cut
08	Const-Q Invers	Serial - ±12dB	Series symmetrical, constant Q — Similar to Nº 7
09	Const-Q New	Serial - +15, -18dB	Series proportional, constant Q — The calculated Q is always maintained in the “middle”, between peak gain and zero. Constant Q EQs are useful for surgical applications. Our proprietary Architecture...try it, we know you'll like it!
10	Const-Q Ideal	Serial - ±15dB	Series ideal & constant Q — Another special, similar to Nº 1, all three parameters (resonant or corner <i>f</i> , gain & Q) are independent, no analog relatives! The calculated Q is always 3dB below peak regardless of gain. At gains ≤3dB, Q is maintained proportionally.
11	Parallel FF-FB	Parallel - ±12dB	Parallel feed forward/feedback — Complementary amplitude and phase characteristics for boost & cut (symmetrical), found in high end graphic EQs, 1 st choice for mastering [reference Massenburg]

<i>Nº</i>	<i>Type</i>	<i>Topology & Range</i>	<i>Description</i>
12	Parallel LC	Parallel - ±15dB	Parallel passive LC — Tonal advantages with Section interaction and asymmetry disadvantages, found in old or newly recreated PEQs, another choice for mastering [reference Massive Passive, Sontec]

Table 1 — Equalizer Architectures

Constant Q is more for surgical applications, while proportional EQs are best when combining multiple overlapping Sections. As a point of reference, API, Pultec, Maselec and Avalon EQs are all of the proportional type.

When switching between serial and parallel topologies, the output will momentarily mute while buffers are initialized.

✦ NOTE: A NOTE ABOUT NORMALIZATION...ALL 12 TOPOLOGIES ARE NORMALIZED TO HAVE EXACTLY THE SAME BELL SHAPE FOR 6.02dB OF BOOST AND A Q OF 0.71. USE THIS FEATURE TO AURALLY COMPARE ARCHITECTURES.

Topologies

Every Architecture has five parametric filter types, including first and second order low and high shelf, first and second order low and high cut, and bell. Set to certain Qs, different bell filters change their bandwidth depending on the boost or cut amount in a specific way. If you combine several Sections together, the resulting setup will leave an individual, Architecture-dependent signature on your mix. To allow practical comparison between different equalizer types in theEQblue, the bells in all Architectures have been normalized as mentioned above. Separate bells look identical for 6.02dB of boost and a Q of 0.71, independent of the chosen PEQ type.

The Classic Symmetrical is the most common bell shape, used in many mixers and outboard equalizers. It is almost but not exactly constant-Q. The three Proportionals emulate bell characteristics which change their bandwidth proportionally to boost or cut: they become narrower above values greater than 6dB of boost or cut and wider for settings less than 6dB of boost or cut. It is said that proportional equalizers behave more musically when used for recording and mixing, since you don't need to correct Q after every amplitude readjustment. Furthermore, there are three other constant-Q equalizers with characteristics mostly used by American manufacturers.

theEQblue also offers two proprietary constant-Q types. The first one, Constant-Q Ideal, is a perfect version of the Classic Symmetrical equal-

izer, having exactly the same bandwidth at any amplitude within the Q's range. To be specific, this is measured 3dB below maximum amplitude at and above 6dB of boost. Such PEQs are impossible to implement in the analog domain. The unique Constant-Q New follows a new Q definition: It preserves exactly the same bandwidth at half the maximum amplitude. This for all adjustable amplitude values including, unlike the classical Q definition, the range below 6dB of boost. Due to its amplitude/bandwidth dependency in terms of the classic Q definition, this new kind of constant-Q PEQ could also be added to the proportional class.

Finally we emulated two vintage parallel equalizers. Almost all parametric PEQs employ a serial Architecture. Unlike a serial parametric equalizer, parallel-connected filters combine differently. They also behave differently in terms of phase. Any time you engage more than one Section, all active Sections interact in both amplitude and phase. The more Sections, the more the lumped frequency response deviates from "flat," and the more the phase response is warped. This special "deficiency," a tendency for Sections to interact, is offset by a pleasant sonic character. The Parallel LC emulates old parallel passive PEQ circuitry built with inductors (L) and capacitors (C). The Parallel FF-FB emulates the feed-forward/feed-back structures still very popular in low noise, analog graphic EQs. While the feed-forward path is trivial to implement, the feedback path is impossible to implement in traditional digital signal processing, because of so called "delay-free" feedback loops. In thEQblue, we apply a very elaborate technique for true emulation of delay-free feedback. The result is a characteristic sound and, in the case of Architecture № 11, perfectly complementary filters for boost and cut.

Shelf & Cut Filter Library

In thEQblue, not only are various bell filters used, but also different kinds of shelving filters. Nine of the serial equalizers use a new shelving filter generation characterized by a cutoff frequency defined in the middle of the transition region. We found these filter definitions more intuitive than the classical "-3dB below maximum" approach. The old definition is only used in the Classic Asymmetrical type to conform to its antecedents. All 2nd order shelving filters have a Q adjustment to emulate vintage characteristics with their specific bumps in the transition region at higher slopes. Also, the parallel equalizers are equipped with respective shelving filter shapes typical of the old parallel PEQs, and they interact with other Sections as did their analog predecessors.

Everybody needs excellent cut filters. In thEQblue, any Section can be assigned a 1st or 2nd order cut. The 2nd order filters have a Q adjustment to create resonant filter characteristics as mentioned previously. Dial in some resonance and listen to the result. Also, high or steep slopes can be attained by cascading several Sections of identical cut filters.

The Controls

Let's start in the lower left corner of the user interface (UI). Then we'll jump to the right side of the UI, before covering the conspicuous graphical Section controls and spectrogram.

All of the lower UI, including the left control stack, the twelve center numeric Sections, and the right control stack, can be hidden or revealed using a show/hide button at far right that resembles tiny Sections. This "fabulous" feature allow the Graph, see below, to dominate the interface.

Figure 3 — The two states of the Hide/Show Sections button

Left Control Cluster

At bottom left are six buttons, five of which have traditional rectangular appearance. The top button looks like a miniature keyboard.

Keyboard

The Keyboard button enables and disables the keyboard. When enabled, the keyboard is visible. Its purpose is to provide a musical and aural reference to quickly locate a tonal aspect or issue within your material. The frequency scale in Hertz, located above the keyboard when visible, directly corresponds to the keys on the Keyboard below.

When you mouse over the Keyboard, individual keys highlight in blue, while C keys are visually labeled along with the middle A at 440 Hz. Click on a key to hear that note played. Note that the keyboard-generated audio does not pass through the spectrogram, so any notes you play are not displayed.

✦ NOTE: DUE TO A PECULIARITY OF WAVELAB, USERS SHOULD BE AWARE THAT THE KEYBOARD ONLY GENERATES SOUND ONCE PLAYBACK HAS STARTED.

SORT

The SORT button reorders all filter Sections according to increasing resonant frequency. This Sort feature allows you to arbitrarily activate and use individual Sections, then sort them in ascending order after the fact.

OVERSAMPLE

thEQblue employs a very low noise and low distortion oversampling technique for achieving analog-like filter characteristics when working with higher frequency EQ at low sample rates. When host CPU resourc-

es permit, Oversampling mode should remain enabled since it automatically is disabled at sample rates above 48 kHz. This will offer better sound quality for EQs at frequencies above 4 kHz.

The Sections

There are twelve EQ Sections available. Resonant frequency, gain, topology, Q or rate of change and Panorama settings are all individually adjustable within each Section.

Numeric fields in each Section can be altered by single or double-clicking within a field, which selects its contents. You can then replace the current value by typing. The tab key moves focus from one field to the next, while shift-tab moves you to the previous or upper field.

If you click-hold in a numeric field, you can drag up or down to continuously change its value via the mouse. Holding down the shift key while mousing provides fine control of that parameter. An alt or option-click resets the value to the default.

In Circuit/Bypass

The button at the top of each Section serves two functions. It acts as an enable/disable switch, and it displays the current positional number of that Section. Clicking on the switch toggles the Section status from its current state, in circuit or bypassed, to the other.

Section numbers are also displayed in the Graph, discussed below, the filter response graphically superimposed on the spectrogram. The number represents the Section's current position in the group of twelve Sections. The Sort button, discussed above, may change a Section's position and thus, its number.

Gain Field

The Gain field displays the current gain, positive or negative. Positive gain is shown in green, while negative gain is shown in red. Filters can have ± 15 dB of gain.

User Tip: If more gain or loss is needed for extreme situations (!), multiple Sections with identical settings can be cascaded.

Type

Below the Gain field is a glyph or dynamic symbol depicting the filter topology selected for that Section. Its function is twofold; First, it's a menu that provides selection of the three filter types or topologies: bell, shelf or cut. Click on the glyph to display the nine menu choices.

The glyph is also contextual in that its appearance changes as you alter the Section's parameters. This provides, at a glance, an easily understood visual overview of each Section's setting.

Shelving Slope

The Q field displays the current Quality Factor (Q), a rate-of-change parameter. Bells and high/low cut filters are specified in Q, a dimensionless number representing resonant frequency divided by bandwidth, while shelving filters can also be thought of as dimensionless rather than the usual dB/octave metric. This is because it really is Q you're controlling "under the hood."

When asked, Dr. Christoph said that, as expected, for higher Q values the slope is steeper. This holds true for bells and low or high cuts. For shelves with slope values greater than 0.7071, the default, the filter starts to create a "bump" or overshoot in both the pass and stop-bands. For slope = 1, the overshoot is almost invisible. However, for a 2nd order shelf with a slope of 3, the maximum, the overshoot is clearly visible. "We have similar definition problems if we want to speak about Q for bells with boost or cut values of less than ± 3 dB," Musialik said. "Mathematically, Q is defined as $F_c / BW @ -3$ dB below max but, in this case, the max is already below 3dB!" He adds that, "For bells, the Q is correct only for 6dB of boost or cut at 3dB above/below the peak value. For other gain settings, Q is different than what is shown in the Q field." A simple way to think of this is that bandwidth is measured at -3dB from the peak gain value for any given bell filter configuration.

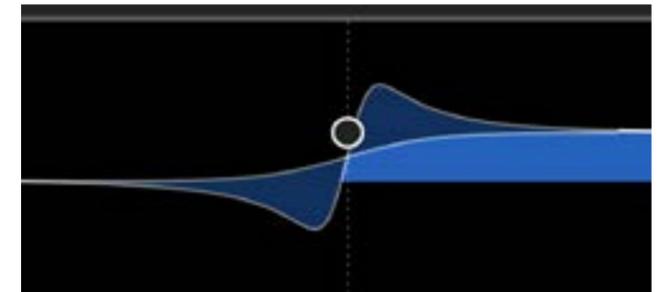

Figure 4 — Superimposed low and high Q settings showing overshoot differences

Panorama Mode

There are five Panorama modes available in thEQblue; stereo, left-only, right-only, mono and difference. While mono is left plus right or mid in an M/S matrixed environment, difference can be thought of as left minus right or the side channel in an M/S world. In Stereo mode, both channels are individually processed by that Section. In Mono mode, the sum of left and right is processed by that Section. Panorama color assignments are user adjustable in User Preferences, discussed below.

✦ **NOTE:** THE TWO M/S PANORAMA MODES, MONO AND DIFF, ARE ONLY AVAILABLE IN THE SERIES ARCHITECTURES. THE PARALLEL ARCHITECTURES NO.S 11 AND 12 OFFER ONLY STEREO, LEFT-ONLY AND RIGHT-ONLY MODES.

Right Control Cluster

To the right of Section 12 is another grouping of controls and displays...

TPL Meter

The top horizontal space in the right control cluster is occupied by an Input/Output switch, followed by a True Peak Level numeric field measured as dBTP. The Input/Output switch determines the source of the True Peak numeric display, either the plug-in's input or output. Values below zero dBTP are shown in green, while overs are displayed in red. Double clicking in the numeric field resets the display.

For those unfamiliar with True Peak measurements, there are some advantages of True Peak or TP measurement versus classical SPPM or Sample Peak Program metering. In contrast to SPPM, TP will detect and display "inter-sample overs," trains of samples that, when converted from the digital domain back into analog, may result in amplitudes in excess of a 0 dBFS sample and potentially an overload of a DAC's output stage. Legacy DACs and many modern DACs will clip the output circuitry during an inter-sample-over event, result in unintended distortion.

✦ **NOTE:** THE TPL DISPLAY IS ONLY USEFUL IF IT IS THE LAST PLUG-IN IN A SIGNAL CHAIN AND THERE IS NO PROCESSING AFTER IT.

Otherwise, the measured amplitude will no longer be inaccurate "downstream" from the plug-in. Also note that, in a floating point signal chain, values occasionally above zero decibels True Peak can be perfectly acceptable as long as there is attenuation before the final capture or output.

ARCHITECTURE

This menu lets you select one of twelve Architectures shown in Tables 1 and 2 above. Architecture names are user adjustable in User Preferences, discussed below. The two curly arrow buttons under the menu are Previous/Next buttons. They let you jump backward (left button) and forward (right button) by one entry within the Architectures menu.

AUTOGAIN

The Autogain function attempts to match gain in and out of bypass, so your ear/brain isn't fooled by differing loudness when the EQ is in circuit. Autogain relies on a Momentary Loudness measurement to provide a baseline at the moment the AUTOGAIN Button is clicked. This also enables the function, as AUTOGAIN is then displayed in blue. Another click on the button will disable the function. At the moment the function is enabled, a "moving window" measurement compares pre-EQ with post and dynamically dials in gain compensation.

To the right of the AUTOGAIN button is an Autogain Reset button. Clicking on this button with the circular arrow symbol resets the baseline value. To the right of Autogain Reset is a numeric display of

the current gain commanded by the Autogain function. As with other numeric fields in the EQblue, you can either click in the field to manually enter a value, or click-drag to continuously alter the value.

When making a critical Section adjustment and assuming Autogain is already enabled, initiate playback then click on Autogain Reset. From that reference, you can then enable and disable Sections without fear that the amplitude changes provided by your EQ settings will bias your judgment. Click on this button again when switching in and out of bypass produces a noticeable change in loudness.

GAIN OUT

Up to ± 12 dB of output gain compensation is available here. Click or click-drag to alter the value.

The Graph

Above the left and right control clusters and center EQ Sections is the Graph or graphical display of the active filter characteristics. All active Sections are shown on the Graph, each with its corresponding shape, panorama color coding and Section number.

Underneath is a horizontal frequency scale, with the EQblue's lower frequency limit of 10 Hz at left, and the Nyquist limit for the current sample rate at right. A vertical amplitude scale at right indicates from ± 3 dB up to ± 21 dB of range, depending on zoom. For more information on zooming, see the discussion below on the "far right controls."

Nodes

Double-click in the Graph to enable a new Section. When hovering over an individual Section "node," the circled Section number, a pennant appears that displays that Section's parameters. Close to the apex of the pennant is a solo button with a headphone appearance, and an enable/bypass control above it.

Bypassed Nodes

Sometimes it is desirable to take a node or Section out of "circuit." When bypassed, a node remains visible but becomes "ghosted" or visually less conspicuous. It shows itself in the Graph but no longer contributes to the Response Curve, see below. A node can be bypassed from either its pennant controls or from the Section controls below the Graph.

To remove a bypassed node or the equivalent resetting a bypassed Section, simply hover over the node in the Graph, and hit the delete or backspace key.

Gain Invert

When you need to ID or notch out a troublesome frequency, it's often easiest to sweep a narrow, high gain bell to aurally locate the frequency. The caret at the apex of the pennant is the Invert Gain

button, which multiplies the active Section's gain by -1. This "flips" the action of the active Section, switching it from boost to cut and allowing you to quickly remove that frequency.

Solo

The Section Solo function, as represented by the headphone symbol, solos that Section. Simply click once to lock it in Solo mode, and click again to disable soloing. "Section Solo Lock" is enabled by default in User Preferences. When that preference is disabled, you must hold down the mouse button to hear the Section solo. User Preferences are discussed near the end of this manual.

Pennant Fields

All fields vertically aligned along the straight side of the pennant are editable. Resonant frequency, gain and, depending on topology, Q are all directly editable as with numeric fields elsewhere in the plug-in. The topology and Panorama callouts are menus, where you can select your choice.

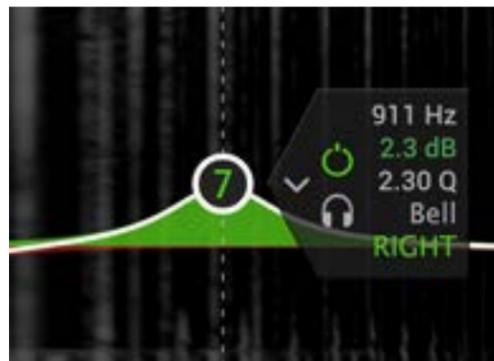

Figure 5 — An active Section node with associated pennant

Active Node

The active node is shown with a color-coded box indicating the panorama mode surrounding the numeric controls, and a vertical dotted line that intersects the horizontal frequency scale. Control or right-click on a keyboard key to force the active node to snap to that keyboard key's frequency.

Once you have grabbed a node, you can move it vertically to change gain and horizontally to change resonant frequency. By holding down the alt or option key while in control of a node, you can change the Q or slope.

Selecting Multiple Nodes

In the Graph, you can marquee multiple nodes to temporarily "group" them. This is most useful for reducing the audibility of multiple Sections once you've gotten basic settings and would like to refine your EQ. Also, if you've applied EQ to multiple harmonics to enhance or suppress

them, this lets you gain adjust them to achieve the desired sound. Once grouped, you can scale the resonant frequency, Q and gain together as a group as long as you use only Node controls in the Graph, not the individual Section controls. Hold down the G key to deselect individual nodes. Shift-drag (marquee) to add more Sections to your current selection.

Textual vs Manual Frequency Settings

The visible resonant or center frequency numeric field is rounded to an integer. "Behind the scenes," the software actually calculates using a 32 bit floating point value. The result is that, while textual frequency entries will be rounded, manual placement of nodes will not. The result is a possible mismatch of actual frequencies between multiple Sections that appear to be set to the same frequency value. This especially obvious when cascading multiple Sections for higher slopes.

Figure 6 — Two cascaded Sections with the "same" apparent setting and differing actual frequencies

Use the numeric keys to select Sections 1 through 10. Simply type the Section number, and the corresponding Section becomes the active node. This selection method does not apply to Sections 11 or 12.

Response Curves

A solid white line graphs the aggregate response of all mono, stereo, left-only and right-only Sections currently active. A less heavy, dotted line displays the aggregate response of all DIFF or left minus right Sections currently active.

⚡ NOTE: THE HEAVY WHITE AGGREGATE RESPONSE CURVE, SHOWING THE COMBINED ACTION OF ALL THE SECTIONS, IS QUITE PRECISE BUT NOT 100% ACCURATE. THOUGH FUTURE RELEASES OF THE EQBLUE WILL REFINE THAT FEATURE, IT'S ALWAYS BEST TO "USE YOUR EARS."

The Spectrogram

The optional spectrogram display provides real time visualization of amplitude versus frequency over time. The actual amount of time displayed depends on the size of the plug-in's UI, but a minimum of 2 seconds can be expected.

Analyzer Input

In the upper left corner of the spectrogram is a small equilateral triangle. When you mouse over the triangle, it lightens to indicate it's active.

Clicking in the triangle produces the Analyzer Input menu, which selects the source for the spectrogram. Four choices are available: Stereo Sum or left plus right, Stereo Difference or left minus right, Left-only and Right-only. Clicking outside the triangle or pressing the *Escape* key hides the Analyzer Input menu. The Analyzer Input setting are also available in User Preferences.

⚠ NOTE: THE ANALYZER INPUT MENU AND OPTIONS ARE HIDDEN WITH MONO PLUG-IN INSTANCES.

Figure 7 — The Analyzer Input menu: Mouse over, click & select

The spectrogram, when visible, is vertically divided into two areas; a color-mapped area, and a gray scale area. A subtle control determines the location of the transition from color to gray scale...see the far right controls discussion directly below.

Shared Controls

The horizontal frequency scale used by the Graph is shared by the spectrogram. Below the spectrogram, and keyboard when visible, are two horizontal, dotted arrow-shaped controls. These Limit Arrows determine the horizontal zoom, scope and position on the frequency axis of both the spectrogram and Graph. By click-dragging either control left or right, you can control the amount of zoom or scope; how wide a range of frequencies are visible at once.

By click-dragging the center of the bar connecting the two arrow controls, you control where on the frequency axis you are viewing. The cen-

ter of the bar, the handle as it were, is marked by five small vertical bars.

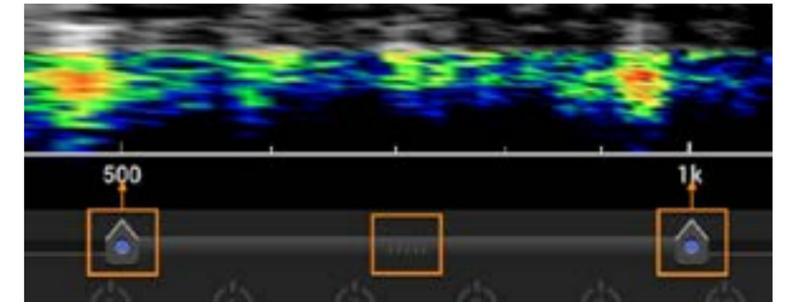

Figure 8 — Controls shared by the spectrogram and Graph

In the illustration above, the left Limit Arrow is set to 500 Hz, while the right Limit Arrow is set to 1000 Hz. The handle is centrally situated between the two.

Far Right Controls

A small meter icon tucked above and to the right of the right hand control cluster hides or reveals a collection of controls and metering that resides at the far right of the UI.

Figure 9 — The meter icon that hides or shows the far right controls

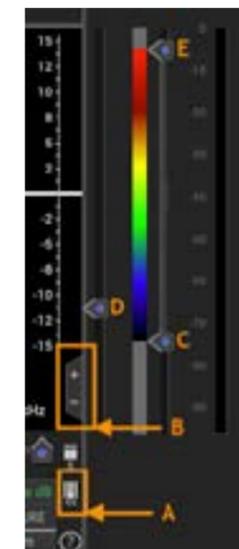

Figure 10 — The far right controls

Bar Graph Icon

The meter button determines visibility of several controls and a global Input Meter. In the figure 10 above, the meter button is labeled “A”.

Vertical Zoom

These plus and minus controls determine the amplitude scope of the Graph. Zoom ranges from $\pm 3\text{dB}$ to $\pm 21\text{dB}$ in six steps. In the above figure, the two Zoom controls are labeled “B”.

Color Mapping

The two arrows, labeled “C” and “E” above, control the color mapping of amplitude in the spectrogram. Arrow C controls the lowest amplitude limit, while arrow E controls the upper amplitude limit. The lowest amplitudes are displayed in the spectrogram as black. Low amplitude is shown in blue. The largest or highest amplitude is displayed in red, while relatively loud material is shown in orange.

Meter

To the right of the Color Mapping controls is a Input Meter. It displays joint left plus right amplitude of the plug-in input, and also shares an amplitude scale with the Color Mapping controls to its left.

The Meter takes its input from the Fast Fourier Transform (FFT) that is used to generate the spectrogram, along with pink noise weighting and RMS-style temporal smoothing. The weighting imparts a better match between subjective levels and what the meter displays.

A word about the presence of the Meter...since all DAWs and many audio suites are equipped with multiple amplitude and Loudness meters, we thought it unnecessary to include yet another fancy meter in thEQblue. This reduces visual clutter and also CPU utilization. After all, doesn't everyone own at least one copy of DRMeter MkII? ;)

Color-to-Gray Scale Transition

The last control shown in the above illustration, labeled “D”, determines the Color-to-Gray Scale Transition. This horizontal arrow dictates the visual transition of recent aural events, shown in color, with earlier more removed aural events shown in gray scale. Click-drag the control up or down to move that transition earlier or later “in time.”

Top Right Controls

Presets

To the right of the thEQblue logo is a User Preset menu and a right flanking Save button. The Save button allows you to store a state, while the Preset menu allows you to recall saved settings. If an existing preset is modified, an asterisk appear after its name.

Figure 11 — The Presets menu and flanking Save button

Holding down the option or alt key switches the Save button to a Delete or remove (preset) button. Simply select a preset from the menu. Then, holding down the modifier key, click the button.

thEQblue presets are stored as cross-platform XML files. For migrating presets from one host to another, you'll find them at...

macOS /Applications/MAAT/thEQblue/Presets

Windows C:\Program Files\MAAT\thEQblue\Presets

A/B

To the left of the Undo/Redo buttons are two buttons labeled A and B. These buttons continuously save into two respective registers or digital data stores, allowing you to switch between them for aural and visual comparison.

When first opened, an instance starts copying the current state into the A register. The first time that you click on B, the state saved in A is copied into B's register. From then on, the states will diverge based on which button is selected. The selected button label is colored, while the unselected's label is white. If a button is selected, then the plug-in's current state is continuously saved into that button's register. Those registers are not persistent, and are only active during an individual DAW session.

✦ NOTE: A AND B **REGISTERS** ARE NOT SAVED AS PART OF YOUR DAW SESSION.

Undo/Redo

To the left of the User Preferences and Bypass buttons are individual Undo and Redo buttons. These circular arrow buttons provide at least 24 levels of undo and redo, though the actual number depends on available memory.

FiDef

FiDef® by FideliQuest (www.fidef.com) is a very low amplitude, psycho-acoustic stimulus designed specifically for audio engineers. FiDef can be thought of as “dither for your brain.” It makes a receptive brain relax and pay closer attention to an incoming audio stimulus. In brain physiology laboratory tests using functional neuroimaging techniques, FiDef

has proven to excite brain activity related to perception and attention, and to enhance the subjective processes of listening and engagement.

Because FiDef is a psychoacoustic process, it may not have an impact if the listener resists its charms. We're talking full-on Jedi mind tricks, folks. If you are like most of us audio engineers, you are very much a "left-brain" person and discount what you cannot understand or explain. You are used to dissecting what you hear, you simply can't help it. Unfortunately, your higher level brain function will suppress your unconscious brain, and FiDef acts subconsciously. Result? If you try too hard to hear it, you probably won't! Though this is in direct opposition to the "impostor syndrome" you've worked so hard to overcome, there will be no noticeable effect if you "listen hard." That is; analytically.

However, your clients, your spouse and most likely your second engineer will notice "something different" about FiDef'd content. That *something* is usually a subtle and positive improvement in engagement and enjoyment. Most folks don't listen analytically, they listen casually and, in the case of music or dialog, for entertainment and enjoyment. That's a right-brain thing, and that's why some of us call our clients "creatives." Their mindset is not, "Hmmm, I hear too much top end lift at 10.5k!" — It's more like, "That synth pad is sooo shiny and purple." or "That vocal is dreamy, it sounds like they're singing right to me."

Cast aside your expectation bias and simply try FiDef. See if you hear an improvement...you may, or may not. Better yet, give your customer two almost identical versions of a song, the only difference being FiDef or no FiDef, and let them decide.

Note that the FiDef implementation in thEQblue is a basic one, meant to reinforce the "analog" nature of the Architectures. While thEQblue includes the four original Profiles, our FiDef JENtwo is a full featured version with new Profiles being added over time.

In Use

In brief, FiDef is either on or off. There are no adjustments, only presets. The FiDef control, its button, is located at upper right. Right-clicking (control-click) on the FiDef button opens a menu displaying the current preset and allowing you to select another preset.

So as to be able to use thEQblue with minimal CPU load and latency, FiDef has four States. For two of these, States 1 and 2, FiDef is completely disabled and inactive; it does not affect the operation of thEQblue.

Figure 12 — The four FiDef states of the FiDef button

By default for a new instance of thEQblue, FiDef is completely disabled, and not loaded into memory. In this state, State 1, there is no effect on CPU utilization or latency.

When a minimum amount of EQ is active, then FiDef is ready to be loaded into memory. This is State 2. Once the minimum EQ requirement is met, then FiDef is ready to be activated but remains disabled. An instance of thEQblue can remain in State 1 or 2 and never incur any penalties on the host computer's resources. For State 2 to be active, a combined EQ greater than or equal to ± 1 dB of adjustment or a low/hi cut must be enabled. FiDef can also be enabled in the FiDef tab in Preferences.

At this point, if you click on the FiDef button, it will transition to State 3. In this state, FiDef has been loaded in memory, but the actual FiDef audio effect is bypassed. State 3 entails increased CPU utilization and latency. If this is undesirable, FiDef can be disabled in the FiDef tab in Preferences.

Clicking on FiDef in State 3 transitions to State 4, with FiDef active and "in circuit." The State 4 button is blue. When in State 4, clicking on the FiDef button returns you to State 3. Once FiDef enters State 3, it will toggle between States 3 and 4 until disabled in Preferences or the instance is removed.

One scenario that is an exception to the above combinations is when FiDef is already in State 4, but then the user removes the minimum amount of active EQ. An example of this would result from bypassing all Sections. In this exceptional case, FiDef would switch to State 3 or 4 as soon as a minimum amount of EQ is restored.

Guidance.

Some usage guidelines are in order...For us artery-hardened audio craftspeople, we suggest you try turning off your monkey brain. We know, it's very difficult to do and not something most of us are practiced at; quite the opposite actually. When listening with FiDef

enabled, turn your chair around so you're not looking at your DAW, desk or displays. Close your eyes, and just chill. FiDef does require about 30 seconds to penetrate your wetware and fully activate your brain, so typical A/B'ing simply will not work. Extend your uninterrupted listening for full effect.

✦ **NOTE:** IN KEEPING WITH FIDELIQUEST'S ORIGINAL DESIGN, WE HAVE HAD TO LOCK OUT FiDEF PROCESSING AT DXD AND HIGHER RATES IN THE INITIAL RELEASE.

We are working with FidelityQuest to add FiDef support up to 384k, so version 3.2 will be fully aligned with our standards. Over time, we will be adding more FiDef capabilities as well. So, stay tuned!

FiDef works best on stems or entire mixes. Go ahead and try it wherever it seems appropriate. The FiDef process can be applied to individual tracks or instruments prior to mixing in order to modify or highlight that material. It can also be applied to an entire mix during mixing or mastering. Individually FiDef'd elements can be mixed then the entire mix can also be FiDef'd with another setting. In the final analysis, FiDef is low amplitude specially correlated noise, as you'll discover when you perform a null test. (I know, you are compelled to do it!) It can be applied multiple time and/or at multiple stages, and it will simply increase the noise floor. So, be thoughtful before applying.

FiDef usually "survives" modern, high bit rate lossy encoding, so go ahead and create high quality lossy children from a FiDef'd parent. That said, please do your own tests to get a sense of its abilities. Also, post-processing may diminish its impact, though EQ should not degrade the effect. Again, it's manifest in the final product as noise, so, most DSP will not degrade FiDef too much.

The inclusion of FiDef in theEQblue is meant to add that eldritch, intangible quality that many people conflate with thermionic electronics. Wrap your head around that! Whether you call them valves, glow-FETs or hollow state, tubes seem to impart a special quality to audio that passes through them. Others bestow that "magic" on analog tape, with its correlated modulation noise. We are not talking about distortion, bandpass restrictions or slew rate limiting, we mean something intrinsic and apart from analog design choices. In fact, that's how FiDef was discovered; as a vestigial signal common to all analog recordings. The already exceptional sound quality of theEQblue, when combined with the indescribable deliciousness of FiDef, raises the whole to an even higher level of beauty and performance. Thomas Joren Neislen, one of our beta testers, told us that, "...the SUTRO Profile is like butter on EDM/electronic stuff."

NOTE: FiDef is not a panacea. It does not and will not work on *all* program material. If you hear unpleasant sounds with FiDef engaged, try disabling it as a check.

Profiles

The FiDef settings consist of four presets or Profiles. Profiles can be selected from Preferences, or by right-clicking on the FiDef button. A lot is happening "under the hood," but there are no other user controls.:

1. TRUKN

Keep on truckin' with subtle sweetness...This is the standard Profile, designed to make any mix have the juicy nuance your client is hoping for.

2. SUTRO

Spread it on...This Profile is designed to draw your attention to frequencies above 8 kHz. The result is a widening of the overall sound stage and an accentuation of transient detail.

3. RESNO

In the air tonight...This Profile draws your attention to the upper mid frequencies. This can have a result of adding throaty qualities to a vocal track or adding harmonic overtones to other instruments.

4. EVOSE

Warm forwardness...This Profile builds on the fundamentals of RESNO and then turns it up to 11. This can be effective on mixes that have had an aggressive smiley-face EQ aspect.

In combination with particular Architectures, go where your creative juices point. We know what they do to us, but find your own label and get comfortable with each. That's why we made it easy to rename them, see the User Preferences section above for details.

A last bit of advice: be open minded. Just because you may not hear it, that's not true of others, especially your clients. Have fun with your content, FiDef can help. Isn't that what audio is supposed to be about?

User Preferences

Clicking on the gear icon in the upper right corner opens the User Preferences...

General Tab

Keyboard Gain

The Gain adjustment sets the repro level for the keyboard sound generator. A range of ± 12 dB is available.

fMODE Root Note

In this tab, you can define the root note for the Semitone, Whole Tone and Minor Third fMODE settings. fMODE and fMode Root Note parameters are automatable.

CPU Saving Mode

To reduce your CPU load, this check box bypasses five subsystems and disabling the following features:

- 1) Spectrogram
- 2) Autogain
- 3) DIFF Monitoring
- 4) TPL metering
- 5) keyboard

Section Solo Lock

This check box toggles the Section Solo Lock mode. The Section Solo Lock option is enabled by default. When disabled, Section Solo requires the user to click and hold. If "Section Solo Lock" is enabled in User Preferences, you no longer need to hold down the mouse button to hear that Section solo'd. Simply click once to lock it in Solo mode, and click again to disable soloing.

Architecture Names

To make it easier to mentally map each Architecture to something less abstract and more familiar, use this menu and button group. For each menu entry, the textual field below allows you to type in a new name. As an example, Proportional 3 becomes "Top Fave". That new name will be substituted for the factory name in the main Architectures menu in the right control cluster. The Reset to Default button reverts the currently selected Architecture back to its factory name.

Save Global Default

The Save State as Global Default button save the current state of the plug-in as the default state it opens into for each new instantiation. Use this button to pre-define your preferred start-up configuration for thEQblue.

Spectrogram Tab

This tab contains three settings; an on/off switch, a brightness setting, and a menu to select which channel to display.

Enabled

The Enable/Disable check box allows you to make the spectrogram invisible if you find it distracting.

User Tip Disabling the spectrogram stops the FFT calculation and, for the graphical interface calculations, it stops mapping and sending info to the GPU. So, if your CPU utilization is taxed, you might try disabling the spectrogram.

Brightness

The Brightness control sets spectrogram brightness, from off at 0.0 and barely visible at 0.1, to moderately bright at 0.5 and crazy bright at the 1.0 setting.

FFT Size

The FFT (window) Size parameter represents the number of samples or, interchangeably, a duration. The FFT Size also expresses into how many frequency "bins" or bands the analysis window will be cut to set the frequency resolution of the window. Window size influences the temporal or frequency resolution of the analysis. Larger sizes result in improved resolution at the expense of CPU utilization.

FiDef Tab

This tab contains three settings, a global bypass along with a menu to select the current Profile, and a widget to rename the Profiles. The Preset Menu at top selects the current FiDef Profile that will be used when FiDef is engaged. With the Enabled box unchecked, FiDef is completely absent. The FiDef code is not loaded, reducing both CPU utilization and latency

To make it easier to mentally map each FiDef Profile to something less abstract and more intuitive, use the renaming widget. For each menu entry, the textual field below allows you to type in a new name. As an example, SUTRO becomes "Butter". That new name will be substituted for the factory name in the Preset menu in FiDef preferences. The Reset to Default button reverts the currently selected Profile back to its factory name.

Colors Tab

The Colors tab allows you to map or define the Panorama colors for each of the five settings. This is useful if you are color-impaired or find one or more of the factory default colors to be unacceptable.

At the upper left of the tab is a menu with the five Panorama modes. When you first open the tab, this menu defaults to STEREO. From this menu, choose any one of the five Pano modes, and map a color of your choosing. You can restore the factory color mapping using the Reset button at upper right.

Current Color/Color Chooser

A banner along the top is filled with the current color, and includes the hexadecimal descriptor for that color. Two digits are shown, for alpha or transparency followed by red, then green, and finally blue.

There are several tools for choosing your color choice. You also have a gamut box, with the current color indicated by a small white circle with black surround. To the right of the gamut box is a hue ramp,

with double arrows indicating the current hue. Finally, along the bottom are RGBA controls with their current individual hex values.

Hot Keys Tab

This tab contains a reminder list of keyboard shortcuts in the EQblue.

fMODE:

For setting other than Continuous, the shift key bypasses frequency quantization

Sections:

Numeric keys:

Select Sections 1 through 10

Numeric fields:

Shift & drag for fine control of setting

Alt/option-click to reset value to default

Enable/Disable (Section On/Off)

Control/right-click to reset Section to default

Mouse wheel:

Change hover-over value

Section Nodes:

Alt/option & drag to change Q or slope

Control/right-click to reset Section to default

Backspace or delete key while hovering over a bypassed node removes it from the Graph

Shift & drag to override fMODE

Mouse wheel to change Q or slope

Control & drag constrains the frequency

Command + arrow keys cycle between solo'd Sections

The s key in Section Solo Lock mode toggles solo'd Sections on and off

Keyboard:

Control/right click to snap active Section to key frequency

Bypass:

Right click disables all Sections

License/Info Tab

This tab contains a link to open this, the user manual; a link to activate or deactivate (“park”) your license along with a list of the contributors and their roles. Note that the current version number and installed CPU Architecture, 32 or 64 bit, is shown at bottom.

Bypass

Below the Preferences gear icon is an “eye” icon. This is a global bypass button that takes all Sections “out of circuit” and removes their DSP load. Right-click on the Bypass button to disable all Sections. This will not reset the Section settings, it will simply turn them off.

User Tip

The Bypass/Disable feature allows you to switch off all active Sections when adapting your setup from a finished song to a new song. With all Sections disabled, you can “walk through” the Sections, evaluating each one in turn to decide on the needed contribution.

Signal Present Meter

To the right of the Preferences gear and the Bypass icon is a three segment meter to show if signal is present and passing through the plug-in. When the spectrogram is disabled, this meter provides basic confidence metering. The three segment, from bottom to top, are:

Green -48 to -18dBFS

Yellow -18 to -2dBFS

Red -2 to 0dBFS

Very low amplitude signals, below -48dBFS, do not illuminate any segments.

Specifications

Latency

The latency is a fixed 1354 samples. As the sample rate increases, the latency in the time domain is reduced since more samples pass through the plug-in per second.

Sample Rate	Latency (seconds)
44100	0.031
48000	0.028
88200	0.015

Resonant Frequency

Effective processing bandwidth per Sample Frequency:

- For 44,100: 20 kHz
- For 48,000: 21.77 kHz

- For 88,200: 40 kHz
- For 96,000: 43.54 kHz
- For 176,400: 80 kHz
- For 192,000: 87.07 kHz
- For 352,800: 160 kHz
- For 384,000: 174.14 kHz

System Requirements

- Mac: macOS 10.8 and newer, 64 bit only
- Win: Windows 7 and newer, 32 & 64 bit
- Pro Tools 10.3.10 and newer
- 4GB RAM minimum

Supported Platforms

- AAX, AU, VST2/3 Mac, VST2/3 Win

Supported Sample Rates

- 44.1 to 384 kHz

Supported Hosts

Ableton Live, Cubase, Logic, Nuendo, Pro Tools, Pyramix, SADiE, Sequoia, Studio One & Wavelab

Updates

Please always use the latest version of the software! You can find your current version on the Info Tab of the back panel. You can download the latest version simply by launching License Central or by visiting:

<http://maat.digital/support/#installers>

For optimal security and stability, you should always stay up to date with Operating System revisions, and we keep up with compatibility changes to our products. We also continue to optimize for reduced CPU load, and this very user manual gets its own improvements.

Support

Appendix One

Constructing Classic Filters

The filter topologies most often used in audio are Butterworth, which is maximally flat in the passband, and Bessel with linear phase in the passband.

The following is excerpted from the wonderful Op Amp Applications Handbook by Walt Jung; Elsevier, 12.15.2004

Butterworth

The Butterworth filter is the best compromise between attenuation and phase response. It has no ripple in the passband or the stopband, and because of this is sometimes called a maximally flat filter. The Butterworth filter achieves its flatness at the expense of a relatively wide transition region from passband to stopband, with average transient characteristics.

Chebyshev

The Chebyshev...filter has a smaller transition region than the same-order Butterworth filter, at the expense of ripples in its passband. This filter gets its name because the Chebyshev filter minimizes the height of the maximum ripple, which is the Chebyshev criterion. Chebyshev filters have 0dB relative attenuation at DC. Odd order filters have an attenuation band that extends from 0dB to the ripple value. Even order filters have a gain equal to the passband ripple. The number of cycles of ripple in the passband is equal to the order of the filter.

Bessel

Butterworth filters have fairly good amplitude and transient behavior. The Chebyshev filters improve on the amplitude response at the expense of transient behavior. The Bessel filter is optimized to obtain better transient response due to a linear phase (i.e. constant delay) in the passband. This means that there will be relatively poorer frequency response (less amplitude discrimination).

Appendix Two

Baxandall Tone Controls

Baxandall Tone Control's are named after their inventor, Peter J. Baxandall. This topology was first published in an [article](#) in Wireless World magazine in 1952. Our CTO, Christoph Musialik, had this to say about Baxandall's special construction:

“Instead of remembering the definition of the Baxandall EQ (originally called the Baxandall Tone Correction Circuit), look at <https://audio-hertz.com/2020/09/09/what-the-fck-is-a-baxandall-eq/>”. There you'll find a good summary. It even includes some history about Baxandall.

Baxandall Tone Correction is simply two shelves, high and low, of 1st order, i.e. 6dB/oct. It corresponds to the easiest RC filter circuits with gentle slopes and smallest possible phase distortion. The pure passive filters are asymmetrical for cut/boost, the active version can be made symmetrical.

The crossing frequency in most circuits is 1000Hz. In general; 500 - 2000 Hz. The Classic Asym Architecture perfectly emulates a passive (asymmetrical) Baxandall.

Just set up high and low shelving (HS & LS), with filter slope of 6dB/oct and Fc for the high shelf of around 10kHz. For the low shelf, go for around 50Hz and you will see a typical Baxandal behaviour.

Regarding the boost/cut at the crossing point, the rule of thumb would be to keep the HS/LS crossing point at around 3dB at high boost or cut values by proper setup of your cut-off frequencies for HS and LS. Both shelves should be the same amount of boost or cut, not a mix of gains.

Best,

Christoph”

About This Manual

Afterword

This manual was written in Adobe InDesign CC 19, and is set in Robert Slimbach's Minion Pro and Myriad Pro. The cover page is set in Aldo Novarese's modernist geometric Eurostyle.
